

Welcome back to the NeuroImaging club!

**Feedbacks from OHBM2026 & REMI2026,
resources, 7T scanner in Lyon and news**

Lyon Neuroscience
Research Center

INSERM UMRS 1028 –
CNRS UMR 5292

25th Sept. 2026

- round-table discussion: introductions and any questions
- feedback from OHBM 2026 conference
- feedback from REMI's network 10th anniversary
- new website for the Club
- sharing useful resources
- news about the 7T scanner coming soon in Lyon
- 2026-2027 meetings

Topics of interest, among others:

- Discussions on AI in neuroImaging
- Nilearn more and more popular for MRI processing & analysis
- Multi-Echo processing & analysis
- Open science

From Pierre-Yves Postic

“Personally, I **love OHBM** – it really is the **Disneyland of neuroimaging** – but I was **frustrated** that I couldn’t see everything I wanted to, mainly because the rooms were too small.

I mainly **used the conference as a way to get a foot in the door for my contract** [...] (foetal imaging, language functions), **and to gather ideas for the paper I’m currently working on from my previous postdoc contract** (long-term consequences of early-onset stroke, white matter microstructure models, a tool for studying the damaged brain, discussions about my two posters).

The same trend as usual:

- studies very much focused **on a very specific cohort** or question relating to a particular disease
- broad studies that use **large databases** as a pretext to go off in all sorts of directions
- people developing **quite interesting tools**, but one wonders how they’ll be generalised
- every now and then, **a gem** with an approach that’s interesting enough and an application close enough to home for us to grasp the nuances.

There are more and more normative approaches, which I find very interesting, but they’re proving to be far less robust than I’d thought, and there’s going to be.”

The OHBM Communications Committee's is looking for new members – students, post-docs, faculty- for 2026-2027: Click [here](#) to apply. Nominations close September 29, 2026.

<https://ohbm.github.io/hackathon2026/>

Hack Track: collaborative project stream of the Brainhack, where teams form around open problems, build tools together, and welcome new contributors throughout the event.

Train Track: learning stream of the Brainhack, where attendees can join tutorials, hands-on sessions, and guided introductions to tools, methods, and workflows.

Objectives of REMI

- to bring together French-speaking individuals involved in academic research projects in MRI
- to improve the overall quality of research
- to promote the sharing of knowledge and tools, and mutual support
- It brings together engineers, researchers, students, postdocs, radiology technicians, clinical research coordinators and doctors.

This network operates on a voluntary basis and through mutual support. It is not intended to provide services or individualised assistance.

Open source hardware

Ensure that machines can be freely built using easily accessible materials with assembly methods that are reproducible and freely documented.

White paper « UTILISATION SECONDAIRE DES DONNÉES D'IMAGERIE À DES FINS DE RECHERCHE »

Published by the French College of Radiology Teachers (CERF), the French Society of Radiology (SFR) and France Life Imaging (FLI).

It's a set of recommendations (not a guide).

For example:

- Do not delete DICOM fields: modify them instead.
 - e.g. do not remove the 'patient name' field, but replace the name with a label
- It is not necessarily a good idea to create a Health Data Warehouse (HDW) as this duplicates the data without knowing whether it will actually be used
- When data is collected, the DRCI file for hospitals must include a section on to re-use the dataset
- Consider, right from the data collection stage, how the data will ultimately be FAIR

Working group: fMRI

- existence of a shared document in need of updating
- joint protocol for Paris and Marseille (shareable data)
- rest study with multi-echo imaging: discussion regarding denoising, which is not straightforward (tedana/fmriprep)
- deepMReyes
- REX toolbox: Enables the study of the reproducibility of a dataset

Working group: 2nd level statistics

- A rather inactive group
- Vaguely defined objectives
- Discussion regarding the issue of two-level group analysis that does not take within-group variance into account (SPM25: no change)
- FSL offers an 'all-in-one' GLM, but there is a major computational problem when performing voxel-wise analysis
- Permutations are OK, but regressors are difficult to define if there are many of them and if there are several levels of variance (site/group/subject)
- adding within-group compcor regressors helps to homogenise the variances
- benefits of multiverse analyses (Maumet & Nichols)
- conclusion: have a simple protocol and focus on a single question

Working group : DWI

Main task: collaborative work to update and improve the DWI wiki of the REMI

A serious game on MRI “Kern spin academie”

PROMI

PROmotion des Méthodes d’Imagerie

Question 23

Quel est le paramètre caractéristique de la relaxation longitudinale ?

KERN SPIN ACADÉMIE

Réponse

Le temps T1 (ou le T1).

KERN SPIN ACADÉMIE

Question 52

A quelle séquence correspond ce chronogramme ?

KERN SPIN ACADÉMIE

Réponse

L'écho de spin 3D.

KERN SPIN ACADÉMIE

Question 16

Quels physiciens ont obtenu le prix Nobel de physique pour la découverte de la RMN ?

KERN SPIN ACADÉMIE

Réponse

Felix BLOCH et Edward PURCELL.

KERN SPIN ACADÉMIE
